Rethinking human-technology relations

This Article Collection aims to address these debates and provide a systematic overview of different disciplinary approaches to the topic of human-technology relations by shifting the focus from human-machine interactions to human-machine relations. Thus, we ask how relations, interactions and relationships between humans and technical systems can be distinguished at the conceptual level and how these distinctions are reflected in practice. On the other hand, different modes of human-technology relations and their preconditions are addressed and analysed: How does, e.g., anthropomorphization influence our relationship to technical systems and "intelligent" environments? How do we need to understand and analyse processes of embodiment in human-technology relations? And how does the question of control and agency change in new HTR?
